Product Brief

TNT HES

What is *TNT HES*?

TNT HES is a combination of natural products specially selected and blended to sup-port and promote the growth and production of forages and pastures, but is suitable for use on other crops as well. The ***TNT HEF*** in ***TNT HES*** works to enhance the benefits of the other ingredients, improving the microbial and plant response to increase crop quality yield.

Why use *TNT HES*? ***TNT HES*** can increase root mass, im-proving water and nutrient availability. The injection of volatile fatty acids, amino acids and minerals into the crop means the plant has the building blocks it needs to ensure higher nutrient density and energy content. The improvement in nutritional and energy status of the plant increases forage quality and allows the plant to better interact with the beneficial soil organisms, improving its natu-ral immunity and resistance to drought, dis-ease and insect pressures. Quality can be shown by visual improvement of the plants and livestock preference of the treated crop; yield by more bales put up in the barn. **Is *TNT HES* for organic or conventional production?** Growers in organic or conventional management systems can benefit from ***TNT HES***. Check with your certifier before using any product in organic production.

When should I use *TNT HES*? ***TNT HES*** is best applied after each cut or grazing but can be used on any crop at any time, from planting and throughout the grow-ing season. ***TNT HES*** can be applied to non-forage crops as often as every 2 weeks at the lower application rate. **How should I use *TNT HES*?** ***TNT HES*** is intended to be used as a foliar, after each cut or grazing, or throughout the growing season on other crops. It can also be soil applied. Adequate dilution is important. See the label for more details.

Application rates

Foliar/soil: 2-8 qt (2-8 L)/acre; 1:10+ dilution

Fertigation: 1:5000 dilution every watering

TNT Hi-Energy Spray is not intended to be the sole input and should be part of a systems approach. Always do a jar test for compatibility when mixing this product with any other inputs.
